

Weekly Influenza **SURVEILLANCE REPORT**

Disease Week 11 Highlights

3/12/2023-3/18/2023

Influenza Cases

- During Week 11, new influenza cases reported have decreased by 87.5% from the previous week (1 vs 8), bringing the total number of influenza cases to 2,654 for the 2022-2023 season so far.
- Notably, the percentage of ED encounters for influenza-like illness continues to increase (8.7% vs 7.1%) at one Long Beach hospital and has been increasing since the week of 2/25/2023. There was a 6.2% increase in influenza-like ED encounters for the 0-4 age group, which was the largest percent increase of any age group from the previous week.
- No new influenza outbreaks or deaths were reported during Week 11.

Influenza Vaccinations

- Approximately 600 Long Beach residents were vaccinated against influenza during Week 11, bringing the total number of flu-vaccinated Long Beach residents to 125,497 for the 2022-2023 season so far.

Respiratory syncytial virus (RSV)

- For the third consecutive week, there were no new RSV cases reported. The total number of RSV cases this season remains at 143.

INFLUENZA CASE COUNT BY MMWR WEEK, 2022-2023

1. Total case counts are based on those reported to public health, the true number of influenza cases are under reported.
2. Outbreaks are defined as at least one case of laboratory confirmed influenza and at least two residents with onset of influenza-like-illness (ILI) within 72 hours. If an outbreak is in the community setting (i.e. school or daycare), outbreak is defined as 5 or more cases of ILI within a group within 72 hours.
3. Number of deaths is based on influenza-coded deaths from death certificates. They are not necessarily laboratory-confirmed and may be an underestimate of all influenza-associated deaths.

Influenza-Like Illness ED Encounters

Influenza-like Illness (ILI) emergency department (ED) encounters are based on syndromic surveillance data from one syndromic-participating hospital in Long Beach. Syndromic surveillance is a population-based symptom monitoring system that uses hospital-based data. This report presents ILI ED encounters from 2020 through the current influenza season (2022-2023). ILI was defined as emergency department encounters with a chief complaint mentioning influenza or fever and cough or fever and sore throat.

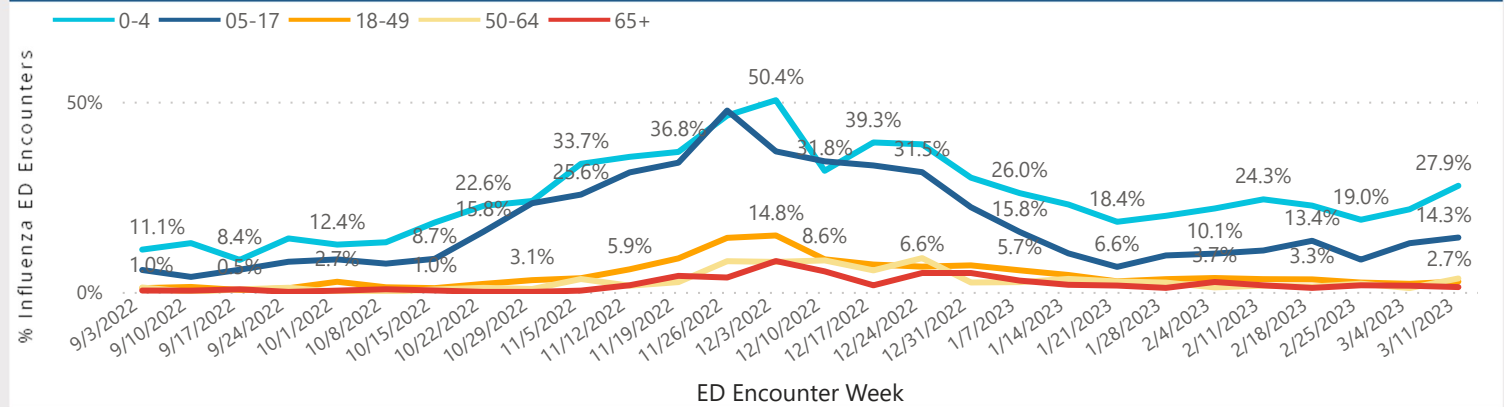

Please note that syndromic keywords and codes specific to ILI are broad enough to include other respiratory conditions including COVID-19. Syndromic surveillance data will have a 1-week lag due to the current data transfer from the county.

Respiratory Syncytial Virus Infection (RSV)

Respiratory syncytial virus, or RSV, is a common respiratory virus that usually causes mild, cold-like symptoms. Most people recover in a week or two, but RSV can be serious, especially for infants and older adults. RSV is the most common cause of bronchiolitis (inflammation of the small airways in the lung) and pneumonia (infection of the lungs) in children younger than 1 year of age in the United States. Clinical symptoms of RSV are nonspecific and can overlap with other viral respiratory infections, as well as some bacterial infections.
