

Weekly Influenza **SURVEILLANCE REPORT**

Disease Week 46 Highlights

11/13/2022 - 11/19/2022

- Since last week, there was an increase of 243 new influenza cases in Long Beach.
- In Week 46, two influenza outbreaks were confirmed in Long Beach. One outbreak was detected in a long-term care facility (LTCF) and the other was detected in the educational sector.
- Most influenza cases were among children 5-17 years (44.7%) followed by those 18-64 years (33.1%).
- There was a 1.8% increase in Influenza-like illness ED encounters compared to the previous week (14.5% versus 16.3%).
- A total of 95 RSV cases have been reported in the 2022-2023 season with 53 RSV cases reported during the month of November.

CASES BY INFLUENZA TYPE, 2022-2023

INFLUENZA CASE COUNT BY MMWR WEEK, 2022-2023

INFLUENZA CASES BY SEASON, 2017 - 2023

1. Total case counts are based on those reported to public health, the true number of influenza cases are under reported.
 2. Outbreaks are defined as at least one case of laboratory confirmed influenza and at least two residents with onset of influenza-like-illness (ILI) within 72 hours. If an outbreak is in the community setting (i.e. school or daycare), outbreak is defined as 5 or more cases of ILI within a group within 72 hours.
 3. Number of deaths is based on influenza-coded deaths from death certificates. They are not necessarily laboratory-confirmed and may be an underestimate of all influenza-associated deaths.

Influenza-Like Illness ED Encounters

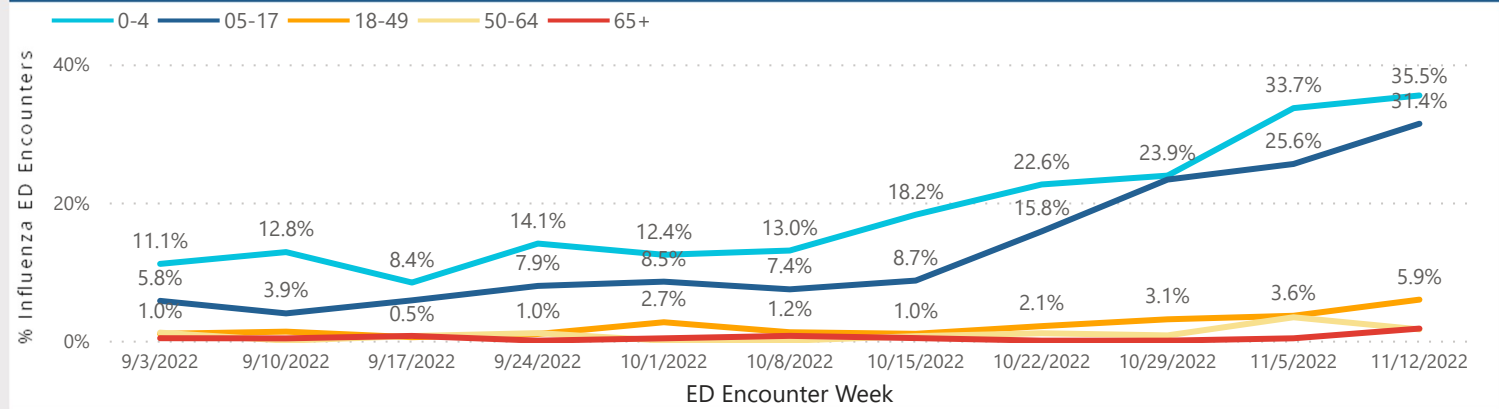

Influenza-like Illness (ILI) emergency department (ED) encounters are based on syndromic surveillance data from one syndromic-participating hospital in Long Beach. Syndromic surveillance is a population-based symptom monitoring system that uses hospital-based data. This report presents ILI ED encounters from 2020 through the current influenza season (2022-2023). ILI was defined as emergency department encounters with a chief complaint mentioning influenza or fever and cough or fever and sore throat. Please note that syndromic keywords and codes specific to ILI are broad enough to include other respiratory conditions including COVID-19. Syndromic surveillance data will have a 1-week lag due to the current data transfer from the county.

Respiratory Syncytial Virus Infection (RSV)

Respiratory syncytial virus, or RSV, is a common respiratory virus that usually causes mild, cold-like symptoms. Most people recover in a week or two, but RSV can be serious, especially for infants and older adults. RSV is the most common cause of bronchiolitis (inflammation of the small airways in the lung) and pneumonia (infection of the lungs) in children younger than 1 year of age in the United States. Clinical symptoms of RSV are nonspecific and can overlap with other viral respiratory infections, as well as some bacterial infections.
